AN Integration of Mitigation and Adaptation options for sustainable Livestock production under climate CHANGE

All Photographs by courtesy of ILRI, INRA, IRTA and TEAGASC.

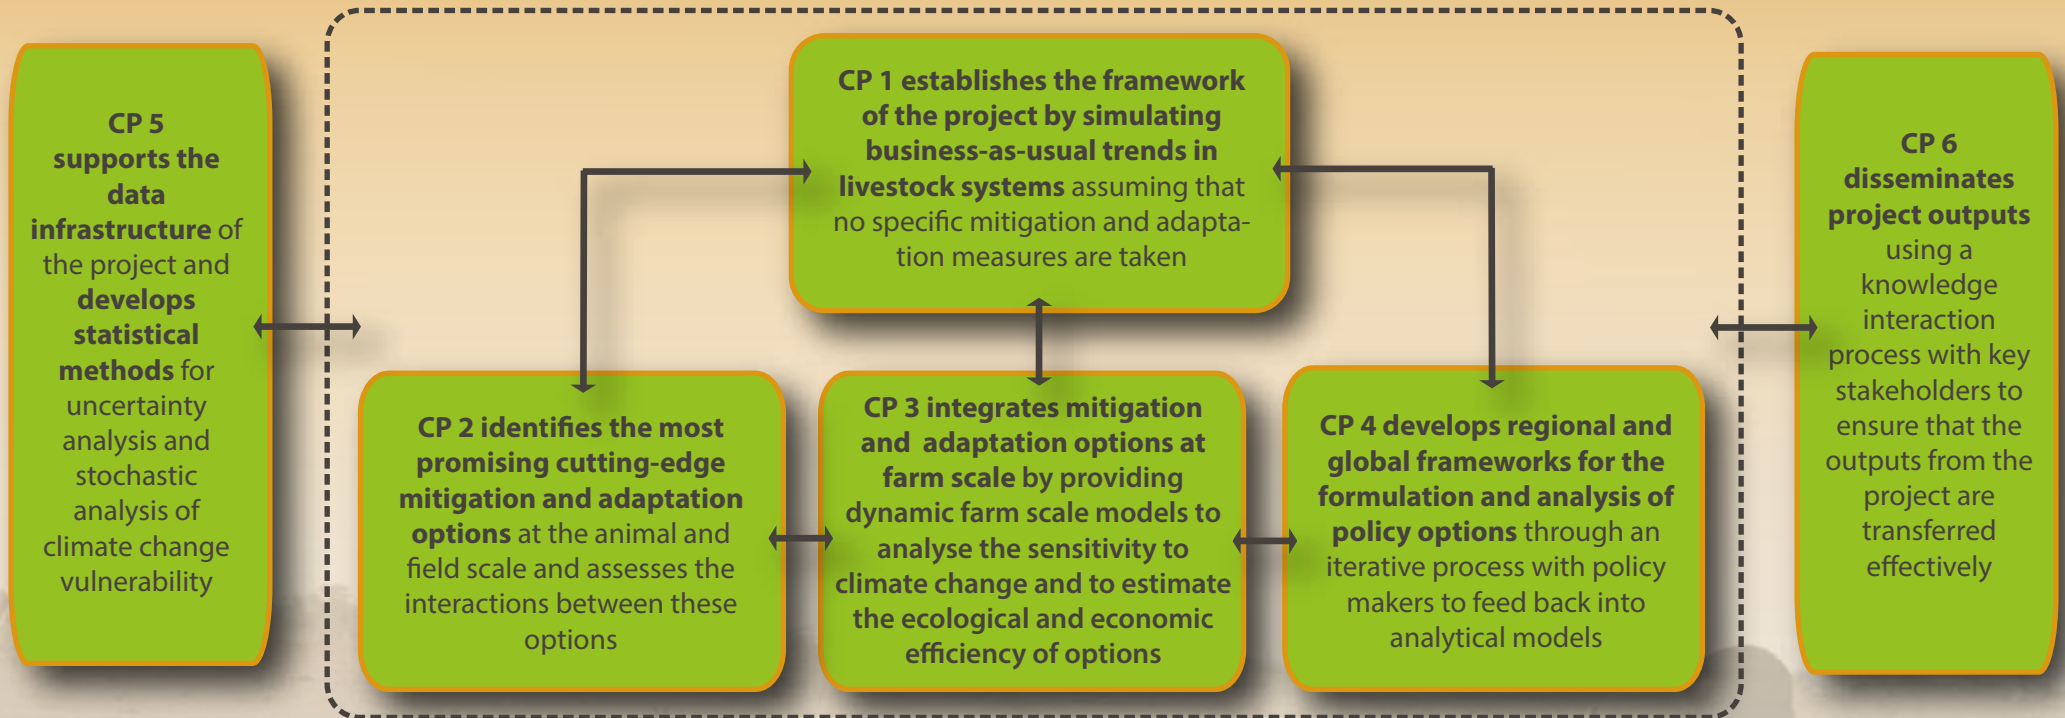

This project has received funding from the European Union's Seventh Framework Programme for research, technological development and demonstration under grant agreement n° 266018

Background and aims

The demand for livestock products is growing and climate change threatens food security and rural livelihoods. Policies that are currently in place may prove insufficient. Livestock systems are a significant contributor to greenhouse gases (GHG) but there is much uncertainty. AnimalChange will for the first time provide a vision of the future of the livestock sector under climate change in Europe, Africa and Latin America.

AnimalChange is divided into 6 inter-related components

AnimalChange will

- **Reduce uncertainties** concerning GHG emissions from livestock systems.
- Include **climate variability** as part of **impact assessment**.
- **Develop cutting-edge technologies** for mitigation and adaptation to climate change.
- **Assess** economic and societal **costs of business as usual** and of adaptation and mitigation scenarios.
- Assess the **vulnerability of livestock to climate change** and **feedbacks on GHG emissions**.
- **Provide direct support** to set up **policies for mitigation and adaptation to climate change for the livestock sector**.
- **Reach out to stakeholders** by organising symposia, training events and forming a network to alert stakeholders of project outputs.
